

# CredShields

# Smart Contract Audit

---

**June 21st, 2023 • CONFIDENTIAL**

## **Description**

This document details the process and result of the Smart Contract audit performed by CredShields Technologies PTE. LTD. on behalf of PePay between June 4th, 2023, and June 9th, 2023, and a retest was performed on June 19th, 2023.

## **Author**

Shashank (Co-founder, CredShields)

# 1. Executive Summary

PePay engaged CredShields to perform a smart contract audit from June 4th, 2023, to June 9th, 2023. During this timeframe, Seven (7) vulnerabilities were identified. **A retest was performed on June 19th, 2023, and all the bugs have been addressed.**

During the audit, Zero (0) vulnerabilities were found with a severity rating of either High or Critical. These vulnerabilities represent the greatest immediate risk to "PePay" and should be prioritized for remediation, and fortunately, none were found.

The table below shows the in-scope assets and a breakdown of findings by severity per asset. Section 2.3 contains more information on how severity is calculated.

| Assets in Scope | Critical | High | Medium | Low | info | Gas | Σ |
|-----------------|----------|------|--------|-----|------|-----|---|
| Smart Contract  | 0        | 0    | 0      | 2   | 3    | 2   | 7 |
|                 | 0        | 0    | 0      | 2   | 3    | 2   | 7 |

*Table: Vulnerabilities Per Asset in Scope*

The CredShields team conducted the security audit to focus on identifying vulnerabilities in Smart Contract's scope during the testing window while abiding by the policies set forth by PePay team.

## State of Security

To maintain a robust security posture, it is essential to continuously review and improve upon current security processes. Utilizing CredShields' continuous audit feature allows both PePay's internal security and development teams to not only identify specific vulnerabilities but also gain a deeper understanding of the current security threat landscape.

To ensure that vulnerabilities are not introduced when new features are added, or code is refactored, we recommend conducting regular security assessments. Additionally, by analyzing the root cause of resolved vulnerabilities, the internal teams at PePay can implement both manual and automated procedures to eliminate entire classes of vulnerabilities in the future. By taking a proactive approach, PePay can future-proof its security posture and protect its assets.

## 2. Methodology

---

PePay engaged CredShields to perform a PePay Smart Contract audit. The following sections cover how the engagement was put together and executed.

### 2.1 Preparation phase

The CredShields team meticulously reviewed all provided documents and comments in the smart-contract code to gain a thorough understanding of the contract's features and functionalities. They meticulously examined all functions and created a mind map to systematically identify potential security vulnerabilities, prioritizing those that were more critical and business-sensitive for the refactored code. To confirm their findings, the team deployed a self-hosted version of the smart contract and performed verifications and validations during the audit phase.

A testing window from June 4th, 2023, to June 9th, 2023, was agreed upon during the preparation phase.

### 2.1.1 Scope

During the preparation phase, the following scope for the engagement was agreed-upon:

| IN SCOPE ASSETS   |
|---|
| <a href="https://github.com/pegasusssx/pepay-contracts/tree/main/src">https://github.com/pegasusssx/pepay-contracts/tree/main/src</a> |

*Table: List of Files in Scope*

### 2.1.2 Documentation

Documentation was not required as the code was self-sufficient for understanding the project.

### 2.1.3 Audit Goals

CredShields uses both in-house tools and manual methods for comprehensive smart contract security auditing. The majority of the audit is done by manually reviewing the contract source code, following SWC registry standards, and an extended industry standard self-developed checklist. The team places emphasis on understanding core concepts, preparing test cases, and evaluating business logic for potential vulnerabilities.

## 2.2 Retesting phase

PePay is actively partnering with CredShields to validate the remediations implemented towards the discovered vulnerabilities.

## 2.3 Vulnerability Classification and Severity

CredShields follows OWASP's Risk Rating Methodology to determine the risk associated with discovered vulnerabilities. This approach considers two factors - Likelihood and Impact - which are evaluated with three possible values - **Low**, **Medium**, and **High**, based on factors such as Threat agents, Vulnerability factors, Technical and Business Impacts. The overall severity of the risk is calculated by combining the likelihood and impact estimates.

| Overall Risk Severity |            |        |        |          |
|-----------------------|------------|--------|--------|----------|
| Impact                | HIGH       | Medium | High   | Critical |
|                       | MEDIUM     | Low    | Medium | High     |
|                       | LOW        | Note   | Low    | Medium   |
|                       |            | LOW    | MEDIUM | HIGH     |
|                       | Likelihood |        |        |          |

Overall, the categories can be defined as described below -

### 1. Informational

We prioritize technical excellence and pay attention to detail in our coding practices. Our guidelines, standards, and best practices help ensure software stability and reliability. Informational vulnerabilities are opportunities for improvement and do

not pose a direct risk to the contract. Code maintainers should use their own judgment on whether to address them.

## **2. Low**

Low-risk vulnerabilities are those that either have a small impact or can't be exploited repeatedly or those the client considers insignificant based on their specific business circumstances.

## **3. Medium**

Medium-severity vulnerabilities are those caused by weak or flawed logic in the code and can lead to exfiltration or modification of private user information. These vulnerabilities can harm the client's reputation under certain conditions and should be fixed within a specified timeframe.

## **4. High**

High-severity vulnerabilities pose a significant risk to the Smart Contract and the organization. They can result in the loss of funds for some users, may or may not require specific conditions, and are more complex to exploit. These vulnerabilities can harm the client's reputation and should be fixed immediately.

## **5. Critical**

Critical issues are directly exploitable bugs or security vulnerabilities that do not require specific conditions. They often result in the loss of funds and Ether from Smart Contracts or users and put sensitive user information at risk of compromise

or modification. The client's reputation and financial stability will be severely impacted if these issues are not addressed immediately.

## **6. Gas**

To address the risk and volatility of smart contracts and the use of gas as a method of payment, CredShields has introduced a "Gas" severity category. This category deals with optimizing code and refactoring to conserve gas.

## 2.4 CredShields staff

The following individual at CredShields managed this engagement and produced this report:

- **Shashank, Co-founder CredShields**
  - [shashank@CredShields.com](mailto:shashank@CredShields.com)

Please feel free to contact this individual with any questions or concerns you have around the engagement or this document.

## 3. Findings

This chapter contains the results of the security assessment. Findings are sorted by their severity and grouped by the asset and SWC classification. Each asset section will include a summary. The table in the executive summary contains the total number of identified security vulnerabilities per asset per risk indication.

### 3.1 Findings Overview

#### 3.1.1 Vulnerability Summary

During the security assessment, Eight (8) security vulnerabilities were identified in the asset.

| VULNERABILITY TITLE                          | SEVERITY      | SWC   Vulnerability Type |
|--|---------------|--------------------------|
| Missing State Variable Visibility            | Informational | Missing Best Practices   |
| Missing Events in important functions        | Low           | Missing Best Practices   |
| Unused Receive/Fallback Functions            | Low           | Missing Best Practices   |
| Functions should be declared External        | Gas           | Gas Optimization         |
| Unused Imports                               | Gas           | Gas Optimization         |
| Missing NatSpec Comments                     | Informational | Missing best practices   |
| Use safeTransferFrom instead of transferFrom | Informational | Missing best practices   |

*Table: Findings in Smart Contracts*

### 3.1.2 Findings Summary

| SWC ID  | SWC Checklist  | Test Result    | Notes  |
|---------|--|----------------|--|
| SWC-100 | <a href="#">Function Default Visibility</a>          | Not Vulnerable | Not applicable after <b>v0.5.X</b> (Currently using solidity <b>v &gt;= 0.8.6</b> )  |
| SWC-101 | <a href="#">Integer Overflow and Underflow</a>       | Not Vulnerable | The issue persists in versions before <b>v0.8.X</b> .  |
| SWC-102 | <a href="#">Outdated Compiler Version</a>            | Not Vulnerable | Version 0 <sup>^</sup> .8.0 and above is used  |
| SWC-103 | <a href="#">Floating Pragma</a>                      | Not Vulnerable | Contract uses floating pragma  |
| SWC-104 | <a href="#">Unchecked Call Return Value</a>          | Not Vulnerable | <b>call()</b> is not used  |
| SWC-105 | <a href="#">Unprotected Ether Withdrawal</a>         | Not Vulnerable | Appropriate function modifiers and require validations are used on sensitive functions that allow token or ether withdrawal. |
| SWC-106 | <a href="#">Unprotected SELFDESTRUCT Instruction</a> | Not Vulnerable | <b>selfdestruct()</b> is not used anywhere   |
| SWC-107 | <a href="#">Reentrancy</a>                           | Not Vulnerable | No notable functions were vulnerable to it.  |
| SWC-108 | <a href="#">State Variable Default Visibility</a>    | Not Vulnerable | Not Vulnerable   |
| SWC-109 | <a href="#">Uninitialized Storage Pointer</a>        | Not Vulnerable | Not vulnerable after compiler version, <b>v0.5.0</b>   |

|         |   |                |  |
|---------|---|----------------|--|
| SWC-110 | <a href="#">Assert Violation</a>                                    | Not Vulnerable | Asserts are not in use.  |
| SWC-111 | <a href="#">Use of Deprecated Solidity Functions</a>                | Not Vulnerable | None of the deprecated functions like <code>block.blockhash()</code> , <code>msg.gas</code> , <code>throw</code> , <code>sha3()</code> , <code>callcode()</code> , <code>suicide()</code> are in use |
| SWC-112 | <a href="#">Delegatecall to Untrusted Callee</a>                    | Not Vulnerable | Not Vulnerable.  |
| SWC-113 | <a href="#">DoS with Failed Call</a>                                | Not Vulnerable | No such function was found.  |
| SWC-114 | <a href="#">Transaction Order Dependence</a>                        | Not Vulnerable | Not Vulnerable.  |
| SWC-115 | <a href="#">Authorization through tx.origin</a>                     | Not Vulnerable | <code>tx.origin</code> is not used anywhere in the code  |
| SWC-116 | <a href="#">Block values as a proxy for time</a>                    | Not Vulnerable | <code>Block.timestamp</code> is not used   |
| SWC-117 | <a href="#">Signature Malleability</a>                              | Not Vulnerable | Not used anywhere  |
| SWC-118 | <a href="#">Incorrect Constructor Name</a>                          | Not Vulnerable | All the constructors are created using the <code>constructor</code> keyword rather than functions.   |
| SWC-119 | <a href="#">Shadowing State Variables</a>                           | Not Vulnerable | Not applicable as this won't work during compile time after version <code>0.6.0</code>   |
| SWC-120 | <a href="#">Weak Sources of Randomness from Chain Attributes</a>    | Not Vulnerable | Random generators are not used.  |
| SWC-121 | <a href="#">Missing Protection against Signature Replay Attacks</a> | Not Vulnerable | No such scenario was found   |

|         |   |                |  |
|---------|---|----------------|--|
| SWC-122 | <a href="#">Lack of Proper Signature Verification</a>                   | Not Vulnerable | Not used anywhere  |
| SWC-123 | <a href="#">Requirement Violation</a>                                   | Not Vulnerable | Not vulnerable   |
| SWC-124 | <a href="#">Write to Arbitrary Storage Location</a>                     | Not Vulnerable | No such scenario was found                                 |
| SWC-125 | <a href="#">Incorrect Inheritance Order</a>                             | Not Vulnerable | No such scenario was found                                 |
| SWC-126 | <a href="#">Insufficient Gas Griefing</a>                               | Not Vulnerable | No such scenario was found                                 |
| SWC-127 | <a href="#">Arbitrary Jump with Function Type Variable</a>              | Not Vulnerable | <b>Jump</b> is not used.                                   |
| SWC-128 | <a href="#">DoS With Block Gas Limit</a>                                | Not Vulnerable | Not Vulnerable.  |
| SWC-129 | <a href="#">Typographical Error</a>                                     | Not Vulnerable | No such scenario was found                                 |
| SWC-130 | <a href="#">Right-To-Left-Override control character (U+202E)</a>       | Not Vulnerable | No such scenario was found                                 |
| SWC-131 | <a href="#">Presence of unused variables</a>                            | Not Vulnerable | No such scenario was found                                 |
| SWC-132 | <a href="#">Unexpected Ether balance</a>                                | Not Vulnerable | No such scenario was found                                 |
| SWC-133 | <a href="#">Hash Collisions With Multiple Variable Length Arguments</a> | Not Vulnerable | <b>abi.encodePacked()</b> or other functions are not used. |
| SWC-134 | <a href="#">Message call with hardcoded gas amount</a>                  | Not Vulnerable | Not used anywhere in the code                              |
| SWC-135 | <a href="#">Code With No Effects</a>                                    | Not Vulnerable | No such scenario was found                                 |
| SWC-136 | <a href="#">Unencrypted Private Data On-Chain</a>                       | Not Vulnerable | No such scenario was found                                 |

## 4. Remediation Status

PePay is actively partnering with CredShields from this engagement to validate the discovered vulnerabilities' remediations. **A retest was performed on June 19th, 2023, and all the issues have been addressed.**

Also, the table shows the remediation status of each finding.

| VULNERABILITY TITLE                          | SEVERITY      | REMEDICATION STATUS          |
|--|---------------|------------------------------|
| Missing State Variable Visibility            | Informational | <b>Fixed</b><br>[19/06/2023] |
| Missing Events in important functions        | Low           | <b>Fixed</b><br>[19/06/2023] |
| Unused Receive/Fallback Functions            | Low           | <b>Fixed</b><br>[19/06/2023] |
| Functions should be declared External        | Gas           | <b>Fixed</b><br>[19/06/2023] |
| Unused Imports                               | Gas           | <b>Fixed</b><br>[19/06/2023] |
| Missing NatSpec Comments                     | Informational | <b>Won't Fix</b>             |
| Use safeTransferFrom instead of transferFrom | Informational | <b>Fixed</b><br>[19/06/2023] |

*Table: Summary of findings and status of remediation*

## 5. Bug Reports

---

Bug ID #1 [Fixed]

### Missing State Variable Visibility

#### Vulnerability Type

Missing Best Practices

#### Severity

Informational

#### Description

In Solidity, the visibility of state variables is important as it determines how those variables can be accessed and modified by other contracts or functions.

The contract defined state variables that were missing a visibility modifier.

#### Affected Code

- </src/PEPAYStaking.sol> - PEPAYFeeSplitter FEE\_ADDRESS

#### Impacts

If the visibility of a state variable is accidentally left out, it can cause unexpected behavior and security vulnerabilities. For example, if a state variable is supposed to be private and is accidentally declared without any visibility keyword, it will be treated as "internal" by default, which may lead to it being accessible by other contracts or functions outside the intended scope. This can lead to a potential attack vector for malicious actors.

#### Remediation

Explicitly define visibility for all state variables. These variables can be specified as public, internal, or private.

## Retest

State variable visibility has been specified.

<https://github.com/pegasusx/pepay-contracts/blob/main/src/PEPAY.sol#L14>

## Bug ID#2 [Fixed]

### Missing Events in important functions

#### Vulnerability Type

Missing Best Practices

#### Severity

Low

#### Description

Events are inheritable members of contracts. When you call them, they cause the arguments to be stored in the transaction's log—a special data structure in the blockchain. These logs are associated with the address of the contract which can then be used by developers and auditors to keep track of the transactions.

The contract was found to be missing these events on certain critical functions which would make it difficult or impossible to track these transactions off-chain.

#### Affected Code

The following functions were affected -

- [/src/PEPAYFeeSplitter.sol](#) - setTEAMWallet(), setSTAKERWallet(), setOPWallet(), setLPWallet()
- [/src/PEPAY.sol](#) - setFeeAddress()
- [/src/PEPAYStaking.sol](#) - setFeeAddress()

#### Impacts

Events are used to track the transactions off-chain and missing these events on critical functions makes it difficult to audit these logs if they're needed at a later stage.

#### Remediation

Consider emitting events for the functions mentioned above. It is also recommended to have the addresses indexed.

## Retest

Events have been emitted for the functions specified above.

<https://github.com/pegasusx/pepay-contracts/blob/main/src/PEPAYFeeSplitter.sol#L54-L76>

<https://github.com/pegasusx/pepay-contracts/blob/main/src/PEPAY.sol#L96>

<https://github.com/pegasusx/pepay-contracts/blob/main/src/PEPAYStaking.sol#L50>

## Bug ID#3 [Fixed]

### Unused Receive/Fallback Functions

#### Vulnerability Type

Missing Best Practices

#### Severity

Low

#### Description

The contract was found to be defining an empty receive function.

It is not recommended to leave them empty unless there's a specific use case such as to receive Ether via an empty receive() function.

#### Affected Code

- /src/PEPAYFeeSplitter.sol
- /src/PEPAY.sol
- /src/PEPAYStaking.sol

#### Impacts

Leaving empty fallback and receive functions may represent missing code or validations when functions are called or ETH is sent to the contract.

#### Remediation

It is recommended to go through the code to make sure these functions are properly implemented and are not missing any validations in the definition.

#### Retest

Receive and fallback functions have been removed.

## Bug ID#4 [Fixed]

### Functions should be declared External

#### Vulnerability Type

Gas Optimization

#### Severity

Gas

#### Description

Public functions that are never called by a contract should be declared external in order to conserve gas.

The following functions were declared as public but were not called anywhere in the contract, making public visibility useless.

#### Affected Code

The following functions were affected -

- [/src/PEPAY.sol](#) - setMax()
- [/src/PEPAYStaking.sol](#) - setStart()
- [/src/PEPAY.sol](#) - deposit()

#### Impacts

Smart Contracts are required to have effective Gas usage as they cost real money and each function should be monitored for the amount of gas it costs to make it gas efficient.

**“public”** functions cost more Gas than **“external”** functions.

#### Remediation

Use the **“external”** state visibility for functions that are never called from inside the contract.

#### Retest

PEPAY.deposit() function has been removed. The other functions have been updated as external.

## Bug ID#5 [Fixed]

### Unused Imports

#### Vulnerability Type

Gas Optimization

#### Severity

Gas

#### Description

Solidity is a Gas-constrained language. Having unused code or import statements incurs extra gas usage when deploying the contract.

The contract was found to be importing the file ERC20Burnable.sol in PEPAYFeeSplitter.sol which is not used anywhere in that contract.

#### Affected Code

The following functions were affected -

- /src/PEPAYFeeSplitter.sol - import  
"@openzeppelin/contracts/token/ERC20/extensions/ERC20Burnable.sol";

#### Impacts

Having unnecessary dead code in the production contract costs extra gas and makes it difficult for auditors and developers.

#### Remediation

It is recommended to remove the import statement if it's not supposed to be used.

#### Retest

The dead code has been removed.

Bug ID#6 [Won't Fix]

## Missing NatSpec Comments

### **Vulnerability Type**

Missing best practices

### **Severity**

Informational

### **Description:**

Solidity contracts use a special form of comments to document code. This special form is named the Ethereum Natural Language Specification Format (NatSpec).

The document is divided into descriptions for developers and end-users along with the title and the author.

The contracts in the scope were missing these comments.

### **Impacts:**

Without Natspec comments, it can be challenging for other developers to understand the code's intended behavior and purpose. This can lead to errors or bugs in the code, making it difficult to maintain and update the codebase. Additionally, it can make it harder for auditors to evaluate the code for security vulnerabilities, increasing the risk of potential exploits.

### **Remediation:**

Developers should review their codebase and add Natspec comments to all relevant functions, variables, and events. Natspec comments should include a description of the function or event, its parameters, and its return values.

### **Retest:**

Won't fix.

Bug ID#7 [Fixed]

## Use safeTransferFrom instead of transferFrom

### Vulnerability Type

Missing best practices

### Severity

Informational

### Description:

The transferFrom() method is used instead of safeTransferFrom(), presumably to save gas however OpenZeppelin's documentation discourages the use of transferFrom(), use safeTransferFrom() whenever possible.

### Affected Code

- [PEPAYStaking.sol](#) - initialize()

### Impacts:

Using safeTransferFrom has the following benefits -

- It checks the boolean return values of ERC20 operations and reverts the transaction if they fail,
- at the same time allowing you to support some non-standard ERC20 tokens that don't have boolean return values.
- It additionally provides helpers to increase or decrease an allowance, to mitigate an attack possible with vanilla approve.

### Remediation:

Consider using safeTransferFrom instead of transferFrom.

### Retest

safeTransferFrom is used now instead of transferFrom.
