# Smart Contract Audit

---

**05/08/2024 • CONFIDENTIAL**

## **Description**

This document details the process and result of the Kaku Finance Smart Contracts audit performed by CredShields Technologies PTE. LTD. on behalf of Emblum Labs Limited between 01/08/2024, and 02/08/2024. A retest was performed on 03/08/2024.

# 1. Executive Summary

Emblum Labs Limited engaged CredShields to perform a smart contract audit from 01/08/2024 to 02/08/2024. During this timeframe, 5 vulnerabilities were identified. **A retest was performed on 03/08/2024, and all the bugs have been addressed.**

During the audit, 0 vulnerabilities were found with a severity rating of either High or Critical. These vulnerabilities represent the greatest immediate risk to "Kaku Finance" and should be prioritized for remediation, and fortunately, none were found.

The table below shows the in-scope assets and a breakdown of findings by severity per asset. Section 2.3 contains more information on how severity is calculated.

Assets in Scope	Critical	High	Medium	Low	info	Gas	Σ
Kaku Finance Smart Contracts	0	0	0	3	0	2	5
	0	0	0	3	0	2	5

*Table: Vulnerabilities Per Asset in Scope*

The CredShields team conducted the security audit to focus on identifying vulnerabilities in Kaku Finance Smart Contracts's scope during the testing window while abiding by the policies set forth by the Emblum Labs Team.

## State of Security

To maintain a robust security posture, it is essential to continuously review and improve upon current security processes. Utilizing CredShields' continuous audit feature allows both Emblum Labs Limited's internal security and development teams to not only identify specific vulnerabilities but also gain a deeper understanding of the current security threat landscape.

To ensure that vulnerabilities are not introduced when new features are added, or code is refactored, we recommend conducting regular security assessments. Additionally, by analyzing the root cause of resolved vulnerabilities, the internal teams at Emblum Labs Limited can implement both manual and automated procedures to eliminate entire classes of vulnerabilities in the future. By taking a proactive approach, Emblum Labs Limited can future-proof its security posture and protect its assets.

## 2. Methodology

---

Emblum Labs Limited engaged CredShields to perform a Smart Contract audit. The following sections cover how the engagement was put together and executed.

### 2.1 Preparation phase

The CredShields team meticulously reviewed all provided documents and comments in the smart contract code to gain a thorough understanding of the contract's features and functionalities. They meticulously examined all functions and created a mind map to systematically identify potential security vulnerabilities, prioritizing those that were more critical and business-sensitive for the refactored code. To confirm their findings, the team deployed a self-hosted version of the smart contract and performed verifications and validations during the audit phase.

A testing window from 01/08/2024 to 02/08/2024 was agreed upon during the preparation phase.

### 2.1.1 Scope

During the preparation phase, the following scope for the engagement was agreed upon:

IN SCOPE ASSETS
<a href="https://github.com/kakufinance/Kaku-SmartContract/tree/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd">https://github.com/kakufinance/Kaku-SmartContract/tree/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd</a>

*Table: List of Files in Scope*

### 2.1.2 Documentation

Documentation was not required as the code was self-sufficient for understanding the project.

### 2.1.3 Audit Goals

CredShields uses both in-house tools and manual methods for comprehensive smart contract security auditing. The majority of the audit is done by manually reviewing the contract source code, following SWC registry standards, and an extended industry standard self-developed checklist. The team places emphasis on understanding core concepts, preparing test cases, and evaluating business logic for potential vulnerabilities.

## 2.2 Retesting phase

Emblum Labs Limited is actively partnering with CredShields to validate the remediations implemented towards the discovered vulnerabilities.

## 2.3 Vulnerability classification and severity

CredShields follows OWASP's Risk Rating Methodology to determine the risk associated with discovered vulnerabilities. This approach considers two factors - Likelihood and Impact - which are evaluated with three possible values - **Low**, **Medium**, and **High**, based on factors such as Threat agents, Vulnerability factors, and Technical and Business Impacts. The overall severity of the risk is calculated by combining the likelihood and impact estimates.

Overall Risk Severity				
Impact	HIGH	Medium	High	Critical
	MEDIUM	Low	Medium	High
	LOW	Note	Low	Medium
		LOW	MEDIUM	HIGH
	Likelihood			

Overall, the categories can be defined as described below -

### 1. Informational

We prioritize technical excellence and pay attention to detail in our coding practices. Our guidelines, standards, and best practices help ensure software stability and

reliability. Informational vulnerabilities are opportunities for improvement and do not pose a direct risk to the contract. Code maintainers should use their own judgment on whether to address them.

## **2. Low**

Low-risk vulnerabilities are those that either have a small impact or can't be exploited repeatedly or those the client considers insignificant based on their specific business circumstances.

## **3. Medium**

Medium-severity vulnerabilities are those caused by weak or flawed logic in the code and can lead to exfiltration or modification of private user information. These vulnerabilities can harm the client's reputation under certain conditions and should be fixed within a specified timeframe.

## **4. High**

High-severity vulnerabilities pose a significant risk to the Smart Contract and the organization. They can result in the loss of funds for some users, may or may not require specific conditions, and are more complex to exploit. These vulnerabilities can harm the client's reputation and should be fixed immediately.

## **5. Critical**

Critical issues are directly exploitable bugs or security vulnerabilities that do not require specific conditions. They often result in the loss of funds and Ether from Smart Contracts or users and put sensitive user information at risk of compromise

or modification. The client's reputation and financial stability will be severely impacted if these issues are not addressed immediately.

## **6. Gas**

To address the risk and volatility of smart contracts and the use of gas as a method of payment, CredShields has introduced a "Gas" severity category. This category deals with optimizing code and refactoring to conserve gas.

## 2.4 CredShields staff

The following individual at CredShields managed this engagement and produced this report:

- **Shashank, Co-founder CredShields**
  - [shashank@CredShields.com](mailto:shashank@CredShields.com)

Please feel free to contact this individual with any questions or concerns you have about the engagement or this document.

## 3. Findings

This chapter contains the results of the security assessment. Findings are sorted by their severity and grouped by the asset and SWC classification. Each asset section will include a summary. The table in the executive summary contains the total number of identified security vulnerabilities per asset per risk indication.

### 3.1 Findings Overview

#### 3.1.1 Vulnerability Summary

During the security assessment, 5 security vulnerabilities were identified in the asset.

VULNERABILITY TITLE	SEVERITY	SWC   Vulnerability Type
Outdated Compiler Version	Low	Outdated Compiler Version ( <a href="#">SWC-102</a> )
Use Ownable2Step	Low	Missing Best Practices
Missing Events in Important Functions	Low	Missing Best Practices
Cheaper Inequalities in if()	Gas	Gas Optimization
Cheaper Conditional Operators	Gas	Gas Optimization

*Table: Findings in Smart Contracts*

### 3.1.2 Findings Summary

SWC ID	SWC Checklist	Test Result	Notes
SWC-100	<a href="#">Function Default Visibility</a>	Not Vulnerable	Not applicable after <b>v0.5.X</b> (Currently using solidity <b>v &gt;= 0.8.6</b> )
SWC-101	<a href="#">Integer Overflow and Underflow</a>	Not Vulnerable	The issue persists in versions before <b>v0.8.X</b> .
SWC-102	<a href="#">Outdated Compiler Version</a>	Not Vulnerable	Buig ID #1
SWC-103	<a href="#">Floating Pragma</a>	Not Vulnerable	The contract is not using a floating pragma
SWC-104	<a href="#">Unchecked Call Return Value</a>	Not Vulnerable	<b>call()</b> is not used
SWC-105	<a href="#">Unprotected Ether Withdrawal</a>	Not Vulnerable	Not vulnerable
SWC-106	<a href="#">Unprotected SELFDESTRUCT Instruction</a>	Not Vulnerable	<b>selfdestruct()</b> is not used anywhere
SWC-107	<a href="#">Reentrancy</a>	Not Vulnerable	No notable functions were vulnerable to it.
SWC-108	<a href="#">State Variable Default Visibility</a>	Not Vulnerable	Not Vulnerable
SWC-109	<a href="#">Uninitialized Storage Pointer</a>	Not Vulnerable	Not vulnerable after compiler version, <b>v0.5.0</b>
SWC-110	<a href="#">Assert Violation</a>	Not Vulnerable	Asserts are not in use.
SWC-111	<a href="#">Use of Deprecated Solidity Functions</a>	Not Vulnerable	None of the deprecated functions like

			<code>block.blockhash()</code> , <code>msg.gas</code> , <code>throw</code> , <code>sha3()</code> , <code>callcode()</code> , <code>suicide()</code> are in use
SWC-112	<a href="#">Delegatecall to Untrusted Callee</a>	Not Vulnerable	Not Vulnerable.
SWC-113	<a href="#">DoS with Failed Call</a>	Not Vulnerable	No such function was found.
SWC-114	<a href="#">Transaction Order Dependence</a>	Not Vulnerable	Not Vulnerable.
SWC-115	<a href="#">Authorization through tx.origin</a>	Not Vulnerable	<code>tx.origin</code> is not used anywhere in the code
SWC-116	<a href="#">Block values as a proxy for time</a>	Not Vulnerable	<code>Block.timestamp</code> is not used
SWC-117	<a href="#">Signature Malleability</a>	Not Vulnerable	Not used anywhere
SWC-118	<a href="#">Incorrect Constructor Name</a>	Not Vulnerable	All the constructors are created using the <code>constructor</code> keyword rather than functions.
SWC-119	<a href="#">Shadowing State Variables</a>	Not Vulnerable	Not applicable as this won't work during compile time after version <code>0.6.0</code>
SWC-120	<a href="#">Weak Sources of Randomness from Chain Attributes</a>	Not Vulnerable	Random generators are not used.
SWC-121	<a href="#">Missing Protection against Signature Replay Attacks</a>	Not Vulnerable	No such scenario was found
SWC-122	<a href="#">Lack of Proper Signature Verification</a>	Not Vulnerable	Not used anywhere
SWC-123	<a href="#">Requirement Violation</a>	Not Vulnerable	Not vulnerable

SWC-124	<a href="#">Write to Arbitrary Storage Location</a>	Not Vulnerable	No such scenario was found
SWC-125	<a href="#">Incorrect Inheritance Order</a>	Not Vulnerable	No such scenario was found
SWC-126	<a href="#">Insufficient Gas Griefing</a>	Not Vulnerable	No such scenario was found
SWC-127	<a href="#">Arbitrary Jump with Function Type Variable</a>	Not Vulnerable	<b>Jump</b> is not used.
SWC-128	<a href="#">DoS With Block Gas Limit</a>	Not Vulnerable	Not Vulnerable.
SWC-129	<a href="#">Typographical Error</a>	Not Vulnerable	No such scenario was found
SWC-130	<a href="#">Right-To-Left-Override control character (U+202E)</a>	Not Vulnerable	No such scenario was found
SWC-131	<a href="#">Presence of unused variables</a>	Not Vulnerable	No such scenario was found
SWC-132	<a href="#">Unexpected Ether balance</a>	Not Vulnerable	No such scenario was found
SWC-133	<a href="#">Hash Collisions With Multiple Variable Length Arguments</a>	Not Vulnerable	<b>abi.encodePacked()</b> or other functions are not used.
SWC-134	<a href="#">Message call with hardcoded gas amount</a>	Not Vulnerable	Not used anywhere in the code
SWC-135	<a href="#">Code With No Effects</a>	Not Vulnerable	No such scenario was found
SWC-136	<a href="#">Unencrypted Private Data On-Chain</a>	Not Vulnerable	No such scenario was found

## 4. Remediation Status

Emblum Labs Limited is actively partnering with CredShields from this engagement to validate the discovered vulnerabilities' remediations. **A retest was performed on 03/08/2024, and all the issues have been addressed.**

Also, the table shows the remediation status of each finding.

VULNERABILITY TITLE	SEVERITY	REMEDICATION STATUS
Outdated Compiler Version	Low	Fixed [03/08/2024]
Use Ownable2Step	Low	Fixed [03/08/2024]
Missing Events in Important Functions	Low	Fixed [03/08/2024]
Cheaper Inequalities in if()	Gas	Won't Fix
Cheaper Conditional Operators	Gas	Won't Fix

*Table: Summary of findings and status of remediation*

## 5. Bug Reports

---

Bug ID #1 [Fixed]

### Outdated Compiler Version

#### Vulnerability Type

Outdated Compiler Version ([SWC-102](#))

#### Severity

Low

#### Description

The smart contract is using an outdated version of the Solidity compiler specified by the pragma directive i.e. 0.8.24. Solidity is actively developed, and new versions frequently include important security patches, bug fixes, and performance improvements. Using an outdated version exposes the contract to known vulnerabilities that have been addressed in later releases. Additionally, newer versions of Solidity often introduce new language features and optimizations that improve the overall security and efficiency of smart contracts.

#### Affected Code

The following contracts were found to be affected:

- <https://github.com/kakufinance/Kaku-SmartContract/blob/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd/src/ClaimKAKU.sol#L2>
- <https://github.com/kakufinance/Kaku-SmartContract/blob/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd/src/KAKU.sol#L2>

#### Impacts

The use of an outdated Solidity compiler version can have significant negative impacts. Security vulnerabilities that have been identified and patched in newer versions remain exploitable in the deployed contract.

Furthermore, missing out on performance improvements and new language features can result in inefficient code execution and higher gas costs.

### **Remediation**

It is suggested to use the 0.8.25 pragma version.

Reference: <https://swcregistry.io/docs/SWC-103>

### **Retest**

The pragma has been updated to 0.8.25.

Bug ID #2 [Fixed]

## Use Ownable2Step

### Vulnerability Type

Missing Best Practices

### Severity

Low

### Description

The "Ownable2Step" pattern is an improvement over the traditional "Ownable" pattern, designed to enhance the security of ownership transfer functionality in a smart contract. Unlike the original "Ownable" pattern, where ownership can be transferred directly to a specified address, the "Ownable2Step" pattern introduces an additional step in the ownership transfer process. Ownership transfer only completes when the proposed new owner explicitly accepts the ownership, mitigating the risk of accidental or unintended ownership transfers to mistyped addresses.

### Affected Code

- <https://github.com/kakufinance/Kaku-SmartContract/blob/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd/src/KAKU.sol#L31>
- <https://github.com/kakufinance/Kaku-SmartContract/blob/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd/src/ClaimKAKU.sol#L37>

### Impacts

Without the "Ownable2Step" pattern, the contract owner might inadvertently transfer ownership to an unintended or mistyped address, potentially leading to a loss of control over the contract. By adopting the "Ownable2Step" pattern, the smart contract becomes more resilient against external attacks aimed at seizing ownership or manipulating the contract's behavior.

### Remediation

It is recommended to use either Ownable2Step or Ownable2StepUpgradeable depending on the smart contract.

### **Retest**

The contracts are now using Ownable2Step instead of Ownable.

Bug ID #3 [Fixed]

## Missing Events in Important Functions

### Vulnerability Type

Missing Best Practices

### Severity

Low

### Description

Events are inheritable members of contracts. When you call them, they cause the arguments to be stored in the transaction's log—a special data structure in the blockchain. These logs are associated with the address of the contract which can then be used by developers and auditors to keep track of the transactions.

The contract was found to be missing these events on certain critical functions which would make it difficult or impossible to track these transactions off-chain.

### Affected Code

The following functions were affected -

- <https://github.com/kakufinance/Kaku-SmartContract/blob/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd/src/ClaimKAKU.sol#L74-L76>

### Impacts

Events are used to track the transactions off-chain and missing these events on critical functions makes it difficult to audit these logs if they're needed at a later stage.

### Remediation

Consider emitting events for important functions to keep track of them.

### Retest

Necessary events have been added to the functions.

Bug ID #4 [Won't Fix]

## Cheaper Inequalities in if()

### Vulnerability Type

Gas & Missing Best Practices

### Severity

Gas

### Description

The contract was found to be doing comparisons using inequalities inside the "if" statement. When inside the "if" statements, non-strict inequalities ( $\geq$ ,  $\leq$ ) are usually cheaper than the strict equalities ( $>$ ,  $<$ ).

### Affected Code

- <https://github.com/kakufinance/Kaku-SmartContract/blob/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd/src/ClaimKAKU.sol#L84>
- <https://github.com/kakufinance/Kaku-SmartContract/blob/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd/src/KAKU.sol#L76>

### Impacts

Using strict inequalities inside "if" statements costs more gas.

### Remediation

It is recommended to go through the code logic, and, **if possible**, modify the strict inequalities with the non-strict ones to save gas as long as the logic of the code is not affected.

### Retest:

This won't be fixed since there's no security impact and it could alter the business logic. The Credshields team agrees with the decision.

Bug ID #5 [Won't Fix]

## Cheaper Conditional Operators

### Vulnerability Type

Gas Optimization

### Severity

Gas

### Description

Upon reviewing the code, it has been observed that the contract uses conditional statements involving comparisons with unsigned integer variables. Specifically, the contract employs the conditional operators  $x \neq 0$  and  $x > 0$  interchangeably. However, it's important to note that during compilation,  $x \neq 0$  is generally more cost-effective than  $x > 0$  for unsigned integers within conditional statements.

### Affected Code

- <https://github.com/kakufinance/Kaku-SmartContract/blob/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd/src/KAKU.sol#L76>
- <https://github.com/kakufinance/Kaku-SmartContract/blob/2854f5392e2e6fdd55e6a0ceb775a9d963cce8bd/src/ClaimKAKU.sol#L84>

### Impacts

Employing  $x \neq 0$  in conditional statements can result in reduced gas consumption compared to using  $x > 0$ . This optimization contributes to cost-effectiveness in contract interactions.

### Remediation

Whenever possible, use the  $x \neq 0$  conditional operator instead of  $x > 0$  for unsigned integer variables in conditional statements.

### Retest

This won't be fixed since there's no security impact and it could alter the business logic. The Credshields team agrees with the decision.
